Acknowledgments

We would like to take this opportunity to thank some of the people who helped us complete this paper. We were only able to obtain or properly interpret some of the data in this paper with help from Craig Turner of the Head Start Bureau and Steve Barnett of the National Institute for Early Education. Helpful comments were also provided by Shannon Christian and Suzanne Freed of the Child Care Bureau. Our special thanks go to Peter Germanis who prepared the initial draft of this paper. The draft of the 1997–2003 report was prepared by Caeli Higney, with additional research and comments provided by Jeff Morrow. It has since twice been updated by Justus Myers and Anne Shi.

Introduction and Summary

This report broadly summarizes the nature and magnitude of the increases in federal and state spending on child care and early childhood education programs between the passage of the 1996 welfare reform law, the Personal Responsibility and Work Opportunity Reconciliation Act (PRWORA), and 2005. This report concludes that total child care and early education spending essentially doubled between 1997 and 2003, but has since declined. During the same period, state-funded prekindergarten/preschool spending increased, but as of 2005, it had not made up all of the decline.

As many as one hundred programs support some aspect of child care or early childhood education.1 Six programs, though, account for almost all government spending in both areas. Four of these programs have as their primary purpose helping low-income mothers2 work outside the home: the Child Care and Development Fund (CCDF), Temporary Assistance for Needy Families (TANF), the Child and Adult Care Food Program (CACFP), and the Social Services Block Grant (SSBG).3 Two of these programs have as their primary purpose providing early childhood education: Head Start and state-funded prekindergarten/preschool programs. Between 1997 and 2001, total spending on five of these programs (all except prekindergarten/preschool programs) rose about 69 percent (or about 17 percent per year), from about $12.04 billion to about $20.39 billion (see figure 1, page 4, and table 1, page 5). Growth then slowed substantially between 2001 and 2003, rising by only about 8 percent, from about $20.39 billion to about $22.06 billion. From 2003 to 2005, total spending declined by about 5 percent to about $20.88 billion, or by about $1.180 billion, with the decline almost entirely in child care spending. State spending, however, on prekindergarten/preschool programs grew rapidly, from an estimated

---

2This report uses “mothers” instead of the more neutral “parents” because it is working mothers who are the predominant basis for CCDF eligibility. About 55 percent of federally CCDF-eligible children live with a single parent, which is assumed to be their mother. And while it is true that in some low-income married-couple families the mother works more hours than the father, these are the exception.

$970 million during the 1991/1992 school year to about $2.84 billion during the 2004/2005 school year.\(^4\) (Unless otherwise indicated, all dollar amounts in this paper are in 2005 dollars.)\(^5\)

Of the remaining child care programs, the vast majority are small—if a $5 million or $10 million program is small—and they are ignored in this analysis.\(^6\) But four other programs have annual spending of more than $200 million and, even though they are not configured to help low-income mothers work, because of their size they are also described: the 21\(^{st}\) Century Community Learning Centers Program; the Individuals with Disabilities Education Act’s (IDEA) Special Education Preschool Grants and Grants for Infants and Families; Title I of the Elementary and Secondary Education Act (ESEA) preschool education funds; and Even Start. To emphasize, because these programs are not now used to provide a substantial amount of child care for low-income families, this report does not include them in its spending estimates, although some other analysts do.\(^7\) Instead, this report explores the possibility of reorienting these programs so that they do so and concludes that two of these programs—the 21\(^{st}\) Century Community Learning Centers Program and Even Start—could be reoriented. Hence, they are potential sources of child care funding (see figure 1, page 4).

This report also describes the growing number of state prekindergarten programs (usually for disadvantaged children) and federal and state tax credits for child care expenditures. Because this paper is about federal program expenditures (and associated state expenditures), it does not include prekindergarten programs in the summary of expenditures. It also does not include tax credits because they provide little assistance to low-income families.

\(^5\)We use the Bureau of Labor Statistics’ (BLS) Consumer Price Index for All Urban Consumers (CPI-U) to adjust for inflation. The programs discussed in this paper use the CPI-U to determine eligibility. (The CPI-U is the most commonly used inflation adjustor.) However, the CPI-U overstates inflation. Although the index has experienced a variety of improvements over the years (thus improving the present and future CPI), the BLS does not adjust historical price indexes to reflect these changes. To address this problem, the BLS established a research series using current methods (CPI-U-RS) which corrects for the overstatement of inflation found in the CPI-U. Had we used this measure, the estimated increases in child care expenditures would be lower (in both absolute and percentage terms).

\(^6\)Among the smaller programs excluded from this report are Early Reading First (about $94 million), the Early Learning Fund/Early Learning Opportunities Act Program (about $34 million), the Child Care Access Means Parents in School program (about $16 million), and the Early Childhood Educator Professional Development program (about $15 million). All of these dollar amounts represent 2004 funding levels, \textit{Melinda Gish, Child Care Issues in the 108\(^{th}\) Congress}, CRS Report RL31817 (Washington, DC: Congressional Research Service, July 20, 2004).

The total spending estimates are divided into three time periods: 1997–2001, 2001–2003, and 2003–2005. These years were chosen because (1) 1997 is the first full year after the enactment of PRWORA’s child care provisions, (2) 1997–2001 is the period when the pace of total spending increases was greatest, (3) 2001–2003 is the period when the pace of total spending increases slowed, (4) 2003–2005 is the period when total spending declined, and (5) 2005 is the most recent year for which complete data are available.

**Figure 1**

*Child Care and Early Childhood Education Spending and Potential Spending*

*Source:* See Appendix A. No consecutive data on prekindergarten/preschool spending are available for the school years prior to 2001/2002.

Sources: See Appendix A.

Notes:

* These totals do not include prekindergarten/preschool spending because data are not available for the particular year.
1. The CCDF expenditure data are the amount states actually spent in a given year including funds carried over from a prior year (as opposed to the amount made available or the amount of the year’s allocation that was actually spent).
2. For Head Start, the local grantees are expected to contribute 20 percent of the total state allocation. These contributions may be in cash or in-kind. They are not included in the expenditure calculation.
3. TANF expenditures exclude TANF transfers and TANF MOE expenditures that could also be claimed as CCDF MOE. All CCDF MOE expenditures are deducted, assuming a complete overlap, even though in some states this exaggerates the amount of overlap and, as a result, understates the amount of TANF child care expenditures that could be counted.
4. For 1981–1996, the calculations for SSBG assume that 20 percent of SSBG outlays are for child care. For 1997–2002, expenditures reflect the amount states actually spent in a given year. (Beginning in 1997, SSBG expenditures include TANF transfers into the SSBG.)
5. Unspent TANF includes cumulative unliquidated obligations and the cumulative unobligated balance.
Pre-Welfare Reform Provisions

Prior to 1988, most federal child care subsidies for low-income families were provided through Title XX of the Social Security Act and the Social Services Block Grant (SSBG).\(^8\) With the passage of the Family Support Act of 1988, two additional funding streams were created: (1) AFDC/JOBS Child Care Program (for AFDC recipients who were working or participating in the JOBS program),\(^9\) and (2) Transitional Child Care (for families who left welfare for work, for up to twelve months).\(^10\) In 1990, Congress added two more funding streams: (1) the At-Risk Child Care Program (for low-income families “at risk” of going on welfare without child care assistance),\(^11\) and (2) the Child Care and Development Block Grant (CCDBG) (for low-income families).\(^12\)

In addition, until the passage of the 1996 welfare reform law, federal law required states to disregard a certain amount of the income of welfare families for work-related child care costs when setting AFDC grant amounts. The now-defunct AFDC dependent care disregards reduced the “countable earned income” of welfare parents who held jobs and, in turn, increased their AFDC grants by the amount equal to their work-related child care expenses (up to $175 per month for each child two years or older and up to $200 per month for each child less than two years old). (Perhaps half of the states or more still use the disregard under their TANF

\(^8\)Other major child care programs were Head Start, the Child and Adult Care Food Program, and the Dependent Care Tax Credit.

\(^9\)The AFDC/JOBS Child Care Program provided states with child care funds for AFDC recipients who were working or participating in approved education, training, and work activities. It was an open-ended entitlement with the same federal matching rate used for AFDC. In FY 1995, federal funding was about $867 million with an average monthly enrollment of 422,049 children. U.S. Department of Health and Human Services, Administration for Children and Families, Child Care Bureau, Federal Child Care Programs in FY 1995 (Washington, DC: HHS, undated), http://www.acf.dhhs.gov/programs/ccb/research/1995.htm (accessed October 2, 2001).

\(^10\)The Transitional Child Care Program provided states with funding for up to twelve months of child care for families leaving AFDC due to employment. It was an open-ended federal entitlement with the same matching rate used for AFDC. In FY 1995, federal funding was about $276 million with an average monthly enrollment of 141,017 children. U.S. Department of Health and Human Services, Federal Child Care Programs in FY 1995.

\(^11\)The At-Risk Child Care Program provided states with child care funds for low-income families who were not on AFDC, but who would be “at risk” of going on welfare without assistance. It was a capped entitlement set at about $384 million annually with the same matching rate used for AFDC. In FY 1995, federal funding was about $367 million with an average monthly enrollment of 198,891 children. U.S. Department of Health and Human Services, Federal Child Care Programs in FY 1995.

\(^12\)The CCDBG provided states with funds for child care for low-income families and to improve the quality and availability of child care generally. In FY 1995, federal funding was about $1.194 billion and the annual, unduplicated count of children served was 662,735. (The average monthly number of children served was unavailable.) U.S. Department of Health and Human Services, Federal Child Care Programs in FY 1995.
programs.) Parents could claim the disregard for any kind of child care, including relative-provided care. Parents were required to present receipts for child care purchased, and, in the case of relative-provided care, the receipt could be a note designating the hours of care used and the amount paid. In FFY 1996, the last year of the program, 73,351 families claimed an average of about $229 per month in child care fees. In that year, total federal and state expenditures on the dependent care disregard were about $195 million.

Although most child care advocates welcomed the funding increases during the time between 1988 and the passage of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, many advocates complained about the overlapping and confusing nature of these child care funding streams. A report from the U.S. Government Accountability Office, for example, described the ninety early childhood programs throughout eleven federal agencies and twenty offices that made up the federal government’s approach to child care.

**Child Care and Development Fund**

As part of the 1996 welfare reform law, Congress partially streamlined the major child care funding streams and provided a framework and incentives for sharp increases in spending. The new welfare law repealed the legislative authority for the three AFDC-related child care programs with differing rules (At-Risk Child Care, AFDC/JOBS Child Care, and Transitional Child Care) and combined their funding with CCDBG funding to create the new Child Care and Development Fund (CCDF).

---

15Besharov, ed., *Enhancing Early Childhood Programs: Burdens and Opportunities*.

18The “CCDF” is not a specific term used in the authorizing legislation, but it is the term used by the Department of Health and Human Services to describe the various child care funding streams.
States may use CCDF funds to aid families with incomes up to 85 percent of the state median income for families of similar size. States are required to give priority to “very low-income” families. Both parents (or one parent in a single-parent family) must be either working or in an employment and training activity, and the child must generally be under age thirteen. (CCDF funds may also be used to subsidize child care for children at risk of abuse or neglect, or who need child care as a protective service.) Under the CCDF, funding is provided in three main categories: mandatory funds, matching funds, and discretionary funds, as described immediately below.

**Mandatory funds** provide a guaranteed level of federal child care funding to states, for which no state matching funds are required. Each state receives a fixed amount each year, equal to the funding it received under the AFDC child care programs in either FFY 1994, FFY 1995, or the average of FFY 1992–1994, whichever is highest. Since 1997, these “guaranteed mandatory” fund appropriations have totaled $1.2 billion per year.

Unused funds may be carried over into future years (with no fiscal year limitation). Federal mandatory funds have no obligation or liquidation deadline, unless federal matching funds (see below, under “Matching funds”) are also requested. If so, the federal mandatory funds must be obligated in the year they are received, but there is no limit on when they must be liquidated. In FFY 2005, states spent about $1.253 billion in federal mandatory funds, including funds obligated in prior years. (This included about $1.116 billion in FFY 2005 funds.)

**Matching funds** are available from the federal government to states that have spent their guaranteed mandatory funds and have met their maintenance-of-effort (MOE) requirements. The

21 *Child Care and Development Block Grant Act, U.S. Code 42 (1990) § 9801, section 658 (P).*

amount of federal matching funds provided to a state depends on the amount of additional, or “state matching,” funds it spends. In FFY 2005, state MOE spending was about $928 million and federal and state matching funds totaled about $2.957 billion.24

Federal matching funds are allocated to states according to their share of children under age thirteen; unclaimed matching funds are redistributed to states that have spent more than their allocation. The annual amount of available federal matching funds increased steadily between FFY 1997 and FFY 2001, from about $793 million to about $1.416 billion. After that, the rate of increase slowed. In FFY 2005, the amount available was about $1.524 billion.25 Federal matching funds must be obligated in the year they are received and must be liquidated within the next fiscal year (that is, spent within two years). In FFY 2005, states spent about $1.524 billion in federal matching funds.26 (This included about $1.287 billion in FFY 2005 funds.)

State maintenance-of-effort (MOE) funds are the amount of their own money that states must spend on child care in order to become eligible for federal matching funds. State MOE requirements are set at the greater of each state’s FFY 1994 or FFY 1995 spending levels in the Title IV-A child care programs and total $888 million nationally (in 2005 dollars). State MOE funds must be obligated and liquidated in the same fiscal year (that is, spent within one year). In FFY 2005, reported state MOE expenditures were about $958 million.27 (Eight states accounted for all of the $70 million in reported MOE spending above the required level.)

State matching funds are state child care expenditures that exceed the state’s MOE level and, thus, can be used to claim federal matching funds. (The state’s matching rate for child care is the same as its FFY 1995 matching rate for Medicaid.)28 State matching funds must be obligated by the end of the year in which the state receives federal matching funds and must be liquidated by the end of the following year (that is, spent within two years). In FFY 2005, state-match spending was about $1.433 billion.29 (This included about $1.253 billion in FFY 2005 funds.)

26Ibid.

28Butler and Gish, The Child Care and Development Block Grant: Background and Funding.

**Discretionary funds** are federal funds (no state match is required) appropriated each year for state child care programs. TANF transfers to the CCDF are treated as discretionary funds.

In 1997, Congress appropriated about $1 billion in discretionary funds, but by FFY 2001, the appropriation had risen to $2 billion, and has since remained at about that level. These funds must be obligated by the end of the fiscal year following the year they are received and must be liquidated within the next fiscal year (that is, spent within three years).

Quality set-asides, described next, are often funded with discretionary funds, and TANF transfers to the CCDF are treated as discretionary funds. In FFY 2005, states spent about $4.242 billion in discretionary funds. (This includes about $2.924 billion in FFY 2005 funds.)

**Quality set-asides** are funds dedicated to “quality improvement” activities, such as practitioner training, technical assistance, and higher pay for child care teachers and staff. The CCDF requires that states spend 4 percent of their total federal and state CCDF expenditures on quality improvement activities, although they may, of course, spend more. In FFY 2004, states spent about $365 million, or 4.8 percent of their FFY 2004 expenditures, on “improving the quality of child care services.”

In addition, Congress has added discretionary funds specifically earmarked for quality improvement activities. In FFY 1997, it created a $23 million fund for after-school resource and referral services. In FFY 1998, it added a $60 million set-aside for “infant and toddler quality improvement,” and in FFY 1999, a $203 million set-aside for “child care quality improvement activities.” In FFY 2001, the set-aside for infants and toddlers rose to about $110 million. In FFY 2005, states spent about $150 million of earmarked funds, including about $99 million on “child care quality improvement activities,” about $38 million on “infant and toddler quality improvement activities.”

---

improvement,” and about $14 million on “child care resources and referral and school age care.”

*TANF transfers to the CCDF*, described above, are treated as discretionary funds and are subject to CCDF rules. A state may transfer up to 30 percent of its federal TANF block grant to the CCDF each year. (States may transfer these funds back to TANF within the next two years.) From FFY 1997 to FFY 2001, TANF transfers to the CCDF rose from about $286 million to about $2.094 billion. In FFY 2005, states transferred a total of about $1.937 billion in TANF funds to the CCDF.

*Program totals* include combined mandatory, matching, and discretionary expenditures under the CCDF, as well as unspent funds. Given the multiplicity and complexity of CCDF funding streams, it may be helpful to recapitulate these numbers.

*Total expenditures* increased greatly after the passage of PRWORA. From 1997 to 2003, total CCDF expenditures rose about 111 percent, from about $4.757 billion to about $10.049 billion. From 2003 to 2005, total expenditures declined by about 7 percent, to about $9.380 billion (about $7.018 billion in federal funds and about $2.362 billion in state funds).

*Unspent CCDF funds* include cumulative unliquidated obligations and the cumulative unobligated balance. Unliquidated obligations are CCDF funds that a state has committed to spend, but has not yet spent, while unobligated funds have not been spent or committed. In FFY 2005, unspent funds totaled about $2.330 billion, including unliquidated obligations of about $2.030 billion and an unobligated balance of about $299 million (all from FFY 2005 funds).

---

38 U.S. Department of Health and Human Services, “Expenditures in FY 2005 by Appropriation Year.”

Number of children served is the average monthly number of children served through the CCDF. In FFY 2005, approximately $9.380 billion in CCDF funds served about 1.75 million children.\textsuperscript{40}

Average per-child costs for CCDF vary by care arrangement. In 2004/2005, the average per-child cost was about $5,372.\textsuperscript{41} In a separate paper, we calculate the cost of CCDF-subsidized care for different durations and arrangements.\textsuperscript{42} In FFY 2004, the average per-child cost of full-time, full-year (fifty hours per week, forty-nine weeks per year) center-based care was about $8,908 (about $8,616 in 2004 dollars); for part-time care, it was about $5,636 (about $5,451 in 2004 dollars).

Temporary Assistance for Needy Families

States can also use unspent Temporary Assistance for Needy Families (TANF) funds on child care. Recognizing that as welfare caseloads fell, the need for child care would grow, the welfare law gives states two ways of using unspent TANF funds to pay for child care: (1) transfer up to 30 percent of their TANF block grant to the CCDF, or (2) use TANF funds directly to pay for child care. Most states do both. TANF funds transferred to the CCDF are counted under CCDF discretionary expenditures (described above, under “TANF transfers to the CCDF”).

Direct TANF expenditures on child care are not limited to helping TANF recipients; they may be used to help “needy families” work or prepare for work. States can define “needy families” essentially as they wish, although most seem to use these funds for TANF-related purposes such as helping families to work while on welfare, to leave welfare for work, and to avoid going on welfare in the first place.

TANF funds are subject to various restraints about when they can be spent—and on what. For example, final TANF regulations stipulate that after FFY 1999, unspent TANF funds (that is, funds carried over from prior years) can only be spent on activities considered to be

\textsuperscript{41}Authors’ calculation based on FFY 2005 expenditures (about $9.380 billion) and the estimated total number of children served in the same year (about 1,746,100).

“assistance.” “Assistance” is defined to include benefits and services to help needy families meet ongoing basic needs, such as food and housing. It generally does not include short-term assistance, work supports such as child care, and services such as counseling. However, child care is generally considered “assistance” if it is used by people who are not employed, unless it is used for a short-term purpose, such as job search. Thus, as of FFY 2000, states have been unable to transfer TANF carryover funds from prior years to the CCDF or to use such funds directly for child care (unless it meets the definition of “assistance”). In practice, this restriction has little effect, because states can simply rearrange the way they spend current and carryover funds, using the current funds for child care and other nonassistance needs and the remaining funds (both current and carryover) on assistance.

**Federal TANF child care expenditures** are the portion of a state’s federal block grant funds that is spent on child care. From FFY 1997 to FFY 2001, these expenditures rose from about $16.40 million to about $1.812 billion. In FFY 2005, they dropped by about 29 percent to about $1.279 billion.

**State TANF child care expenditures** are the portion of their own TANF funds that states spend on child care and report as counting toward their TANF MOE requirements. In FFY 2005, states spent about $1.918 billion in TANF MOE funds and about $928 million in CCDF funds.

---

47PRWORA requires states to spend their state TANF funds at a level equal to 80 percent of what they spent in FFY 1994 (75 percent if they were in compliance with TANF’s work requirements). The CCDF program has a similar MOE requirement, as described above. States can count some of their child care expenditures toward both requirements.

MOE funds on child care. Some of these expenditures may have been counted toward both programs. Excluding the potential overlap leaves about $990 million of TANF MOE child care expenditures in FFY 2005.

**Program totals** under TANF include federal and state direct spending on child care, as well as TANF transfers to the CCDF. Once again, given the multiplicity and complexity of TANF funding streams, it may be helpful to recapitulate these numbers here.

**Total expenditures on child care** increased greatly after the passage of PRWORA. From FFY 1997 to FFY 2001, total expenditures on child care rose nearly 1000 percent, from about $448 million to about $4.924 billion, but have since declined. In FFY 2005, total expenditures amounted to about $4.246 billion.

The above number includes about $1.937 billion of TANF transfers to the CCDF, which this report counts under the CCDF (as do most analysts). Hence, to avoid double-counting, these transfers are subtracted from the above figure. From FFY 1997 to FFY 2002, TANF direct expenditures (not counted under the CCDF) rose from about $162 million to about $2.828 billion. From 2002 to 2005, expenditures declined by about 18 percent, to about $2.309 billion ($1.381 billion in federal funds plus $928 million in state funds not counted toward the CCDF MOE).

**Number of children served** must be estimated because states are not required to report the number of children receiving child care assistance directly from TANF. To estimate the number of children served by TANF, the average cost of serving a child through TANF is assumed to be the same as it is under the CCDF for the relevant year. That would mean that the number of children served in FFY 2001 and FFY 2005 was about 548,663 and 429,821, respectively.

---

50Of child care counting toward TANF MOE, $888 million is also allowed to count toward satisfying the MOE requirements for the Child Care and Development Block Grant. Mark Greenberg and Hedieh Rahmanou, *TANF Spending in 2003* (Washington, DC: CLASP, February 2, 2005), 6.

51There may be some additional state spending on child care that is not reported as TANF or CCDF MOE or matching funds. However, because such spending is not well documented, it is not included in the summary of expenditures.

52The Department of Health and Human Services estimates child care enrollment in the same way; however, it assumes a slightly higher cost per child, which we do not. (The per-child cost under the CCDF is based on total CCDF expenditures rather than direct service expenditures.) See U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation, Child Care Eligibility and Enrollment Estimates for Fiscal Year 2003 (Washington, DC: HHS, April 2005), http://aspe.hhs.gov/hsp/05/cc-elig-est03/index.htm. Actually, it appears that children receiving TANF child care subsidies are 20 percent less likely to use center-based care than children in CCDF. Since center-based care is 15 percent more expensive than other arrangements, the TANF child care per-child cost is probably 2 percent or so less. We ignore this small difference here. [For the finding that
Average per-child costs, in FFY 2005, were $5,372.53

Unspent TANF funds potentially available for child care include cumulative unobligated and, to some extent at least, unliquidated balances as well. As mentioned above, because of the dramatic declines in welfare caseloads, most states have large surpluses of federal TANF funds which can be used to fund services for “needy families.” Thus, unlike CCDF funds which must be spent on child care, TANF funds can be spent on a wide range of activities, with child care as just one example. Although the cumulative national surplus has declined from its peak of about $8.082 billion, it remained high in FFY 2005 at about $3.812 billion.

Unobligated funds are federal TANF funds that have not been committed by the states; they remain in the federal Treasury until states draw them down. States can carry forward unobligated TANF funds for use in future years to meet anticipated needs, and most have done so. As explained above, carryover funds cannot generally be used for child care, but they can be used to free up current year TANF funds, which could then be used for child care. Thus, as a practical matter, unobligated funds are potentially available to increase child care spending.

At the end of FFY 2005, the cumulative national total of unobligated TANF funds was about $2.104 billion.54 There is, however, no telling how much, if any, of these funds might be spent on child care.

Unliquidated obligations are federal TANF funds that a state has committed to spend, but has not yet spent. These funds may remain in the federal Treasury.55 They could include, for example, funds that a state has contracted to pay a private child care provider, but has not yet spent because the child care has not yet been provided or because payment is still being

53Authors’ calculation based on FFY 2005 expenditures (about $2.309 billion) and the estimated total number of children served in the same year (456,449).

14
processed. (If the services have not yet been provided, many state grants and contracts will allow for termination “at the convenience of the government,” which could free the funds for other purposes.)

States can carry forward their unliquidated obligations into future years. At the end of FFY 2005, the cumulative national amount of unliquidated TANF obligations totaled about $1.707 billion. The portion of these funds already committed to child care is not known.

The Deficit Reduction Act of 2005, passed in February of 2006, re-authorized TANF through 2010. Total yearly appropriations increased by $200 million to $3.016 billion for 2006-2010. The program is widely expected to increase work and participation rates among welfare recipients. This will likely increase the call on TANF child care resources, as more working parents will require additional child care assistance.

**Head Start**

Within the framework of developmental, educational, and social services for low-income children and families, Head Start provides the equivalent of child care services for many low-income working mothers. For that reason, it is included in this discussion. Most Head Start programs, however, are only part-day and part-year, so that most of the children whose mothers work full time need supplemental care. Of course, some mothers who do not work and, thus, do not need child care, enroll their children in Head Start because of its other perceived benefits.

**Federal funding** is awarded by the U.S. Department of Health and Human Services directly to more than 1,600 local public or private nonprofit or for-profit agencies. Each state receives an amount equal to the amount it received in FFY 1998, and the remaining funds are distributed proportionately to states on the basis of the number of children less than five years old from families whose income is below the poverty line. Grantees must contribute matching funds equal to 20 percent of the grant, unless they are granted a waiver.

In FFY 2005, grant awards to local agencies totaled about $6.842 billion in federal Head Start funds.

---

State funding is supplemental moneys that some states provide to the Head Start programs in their state. According to the National Institute for Early Education Research (NIEER), in FFY 2005, sixteen states provided supplemental funding to Head Start, that totaled about $152 million.\(^{60}\) State spending varied from about $241,000 (New Hampshire) to about $49 million (Ohio). Some states used these funds to support additional slots in local Head Start programs, while others used some or all of their supplemental funds to enhance services or to provide extended-day or extended-year programming.\(^{61}\) (State spending on Head Start is not included in the summary of expenditures because of the absence of reliable data for earlier years and the possible overlap between this spending and reported CCDF and TANF spending.)\(^{62}\)

Quality set-asides are the amount of Head Start appropriations that must be spent on quality improvement activities, as originally required by the Human Services Reauthorization Act of 1990 (P.L. 101-501).

In 1991, 10 percent of the total Head Start appropriations were set-aside for quality improvement activities. Beginning in 1992, the set-aside was modified to include 25 percent of all new funds.\(^{63}\) Half of these “quality monies” are to be used to raise the salaries of classroom teachers and other staff, for the putative purpose of helping programs recruit and retain quality staff.\(^{64}\) Quality improvement funds can also be spent on providing transportation, improving facilities, and expanding staff training and development.\(^{65}\) In 1999, the set-aside was increased to

---

\(^{63}\)Head Start Expansion and Quality Improvement Act, Public Law 101-501, U.S. Code 42 (1990) § 9835, paragraph a(3) stating that new funds, or “excess funds” are defined as the difference between the current and previous year’s appropriations, after the previous year’s appropriations are adjusted to reflect the percentage change in the Consumer Price Index.

60 percent, with the percent then declining to 50 percent in FFY 2000, 47.5 percent in FFY 2001, and back again to 25 percent in FFY 2003.\textsuperscript{66}

In FFY 2001, quality improvement funding peaked at about $393 million.\textsuperscript{67} Due to a slower growth in Head Start appropriations since then and a drop in the percent required to be spent on such activities, quality improvement funding dropped to about $34 million in FFY 2003.\textsuperscript{68} In FFY 2004, quality improvement funding was required by law to be no less than approximately $41 million.\textsuperscript{69}

**Program totals** under Head Start raise the question of how to count the number of children in the program.

**Total expenditures** increased after the passage of PRWORA, but growth has slowed in recent years. Between FFY 1997 and FFY 2002, federal Head Start expenditures rose from about $4.844 billion to about $7.097 billion, about a 47 percent increase. Between 2002 and 2005,

\begin{itemize}

(A)(i) In order to provide assistance for activities specified in subparagraph (C) directed at the goals specified in subparagraph (B), the Secretary shall reserve, from the amount (if any) by which the funds appropriated under section 639(a) for a fiscal year exceed the adjusted prior year appropriation, a share equal to the sum of–

(I) 60 percent of such excess amount for fiscal year 1999, 50 percent of such excess amount for fiscal year 2000, 47.5 percent of such excess amount for fiscal year 2001, 35 percent of such excess amount for fiscal year 2002, and 25 percent of such excess amount for fiscal year 2003; and

(II) any additional amount the Secretary may find necessary to address a demonstrated need for such activities.

(ii) As used in clause (i), the term “adjusted prior year appropriation” means, with respect to a fiscal year, the amount appropriated pursuant to section 639(a) for the preceding fiscal year, adjusted to reflect the percentage change in the Consumer Price Index for All Urban Consumers (issued by the Bureau of Labor Statistics) during such preceding fiscal year.

\item \textsuperscript{69}School Readiness Act of 2003, HR 2210, 108\textsuperscript{th} Cong., 1\textsuperscript{st} session.
\end{itemize}
spending declined by about three- and one-half percent, to about $6.842 billion.\textsuperscript{70} The latter figure should not be taken as necessarily being a reduction in spending, because most Head Start grantees have unspent, carryover funds.

\textit{Number of children served} depends on which of the three definitions of Head Start enrollment is used.

- “Funded enrollment” is the number of slots financed by some or all of the program’s annual funding sources. The “Head Start Fact Sheet,” published by the Head Start Bureau, reports a funded enrollment number based on the federal grant awards issued in September of each fiscal year. According to the Fact Sheet, the total FFY 2005 funded enrollment was 906,993 children.\textsuperscript{71} The “Head Start Program Information Report” (PIR), however, provides a different figure for funded enrollment because it includes children funded by other sources of support (as reported by grantees at the end of the program year in May or June). For the 2004–2005 program year, the PIR’s figure for total funding of Head Start or Early Head Start enrollment was 910,102 children.\textsuperscript{72}

- “Midyear enrollment,” called “End-of-Month Enrollment” by the Head Start Bureau, is the average number of children reported by grantees as enrolled on the last operating day of June and April. (The months differ from year to year.) Because of program dropouts (some of whose slots are not filled), this definition results in a lower count than “funded enrollment.” In 2004–2005, midyear enrollment was 887,633 children.\textsuperscript{73}

- “Cumulative enrollment,” called “Actual Enrollment” by the Head Start Bureau, is the total number of children reported by grantees as enrolled in Head Start at any time during the year, even if they dropped out or enrolled late, and even if they attended for only one

\textsuperscript{73}U.S. Department of Health and Human Services, “Head Start Program Information Report for the 2004–2005 Program Year.” The average monthly enrollment figure is the average of the end-of-month enrollments reported for June and April (the only end-of-month enrollment figures reported by the PIR).
day. Consequently, this definition results in the highest count of enrolled children. In 2004–2005, cumulative enrollment was 1,065,225 children.\textsuperscript{74}

\textit{Average per-child costs} have been rising steadily since 1990. Between 1990 and 2005, per-child costs rose about 70 percent, from about $4,288 to about $7,287. In the 2003/2004 program year, the cost of part-day, center-based care was about $5,798 (about $5,608 in 2004 dollars); for full-day care, it was about $12,996 (about $12,570 in 2004 dollars).\textsuperscript{75}

However, because Head Start is ordinarily a nine-month, part-day program (September–June), these costs do not reflect the full-time, full-year cost of Head Start. We estimate the average cost of a year of full-time, full-year (fifty hours per week, forty-nine weeks per year) Head Start to be about $21,305 (about $20,607 in 2004 dollars),\textsuperscript{76} or about two- and one-half times the cost of full-time, full year center-based child care (about $8,908, or about $8,616 in 2004 dollars).\textsuperscript{77}

The primary explanation for the growth in costs seems to be the increasing amount of money spent on quality improvements, with other factors, such as lengthening hours of operations, also playing a role. The increase in costs per child, the slowing of increases in Head Start funding, along with the expansion of other federally funded child care programs for low-income families, such as the CCDF, and the continued expansion of prekindergarten/preschool programs, have resulted in a smaller relative role for Head Start in the child care world. From 1990 to 2005, Head Start expenditures fell from 49 percent to 33 percent of total child care expenditures (see table 1, page 5). In the 2000–2001 program year, Head Start served fewer than half of all income-eligible three- and four-year-olds (see figure 2, below).

\textsuperscript{74}U.S. Department of Health and Human Services, “Head Start Program Information Report for the 2004–2005 Program Year.”

\textsuperscript{75}Besharov, Myers, and Morrow, “Costs Per Child for Early Childhood Education and Care.”

\textsuperscript{76}Besharov, Myers, and Morrow, “Costs Per Child for Early Childhood Education and Care.”

\textsuperscript{77}This cost includes monthly payments to providers, parental copayments, administrative and quality spending under the CCDF, and the Child and Adult Care Food Program (CACFP) subsidy. See Besharov, Myers, and Morrow, “Costs Per Child for Early Childhood Education and Care.”
Figure 2
Combined Coverage of Poor Children in Head Start and Selected Other Arrangements
(At enrollment, 2000/2001)

Sources: See Appendix A.

Note: “Other” represents the remainder of Head Start-eligible children who are not in Head Start; prekindergarten; kindergarten; school; or full-time, subsidized care. Thus, the children in the “Other” category are in, but not limited to, the following arrangements: free, full-time care by the child’s relative (when not subsidized); part-time, subsidized care; and any unduplicated children in child care funded through the Individuals with Disabilities Education Act, through Title I of the Elementary and Secondary Education Act, and through Even Start.

State-Funded Prekindergarten/Preschool Programs

The foregoing programs are all funded with either federal funds alone or combinations of federal and state funds. Many states, however, also use their own funds to support child care and
early education through their state prekindergarten/preschool programs, which serve mostly low-income children. Spending on these programs has increased sharply.

The federal government does not maintain a comprehensive source of information on state-funded prekindergarten/preschool programs. To fill this gap, the National Institute for Early Education Research (NIEER) conducts regular surveys of state and local programs. According to the NIEER, state spending on these programs increased greatly over the last decade and a half. Comparing its estimates with those of the Children’s Defense Fund, it appears that state spending on these programs about tripled between the 1991/1992 and 2004/2005 school years, going from about $970 million to about $2.84 billion. In 2005/2006, spending increased to nearly $3.2 billion (about $3.3 billion in 2005 dollars), which included federal TANF funds “directed toward preschool at states’ discretion.”

School-based prekindergarten/preschool programs now enroll more children (of all incomes) than Head Start, and at their current growth rate, they will soon be the dominant early childhood education program for low-income children. According to the U.S. Department of Education, total prekindergarten/preschool enrollment (of all ages and incomes) almost tripled

---

79The National Institute for Early Education Research, *The State of Preschool: 2004 State Preschool Yearbook*, stating: “Most states targeted their programs to low-income children and children with other background factors that place them at risk for starting school behind their peers.”

81Barnett and Robin, “How Much Does Quality Preschool Cost?”

between 1990/1991 and 2000/2001 (the latest year with comparable data), rising from about 300,000 children to about 800,000 children.83

Total state expenditures prekindergarten/preschool programs have grown rapidly, from an estimated $970 million during the 1991/1992 school year to about $2.84 billion during the 2004/2005 school year.84

Number of children served, between the 1991/1992 school year and the 2004/2005 school year, climbed from 290,00085 to over 800,000.86 Although the data have many weaknesses, as illustrated by varying estimates of enrollment, the overall trend is clear: prekindergarten/preschool enrollment has increased substantially over the past decade.

Average per-child costs, in the 2004/2005 school year, were about $3,550.87

NOTE: State-funded prekindergarten/preschool programs are not included in the summary of expenditures because of a lack of reliable data from earlier years. These programs, however, may provide the equivalent of child care services that help low-income mothers work.

83 U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics 2003*, NCES 2005-025, “Table 40. Enrollment in public elementary and secondary schools, by level and grade: Fall 1987 to fall 2001,” (Washington: U.S. Department of Education, 2004), available from: http://nces.ed.gov/programs/digest/d03/tables/dt040.asp, accessed April 11, 2005. These data on 1990/1991 and 2000/2001 prekindergarten enrollment come from the Common Core of Data, as reported by Department of Education’s *Digest of Education Statistics*. Throughout this document, we base our estimates of 2000/2001 prekindergarten enrollment on data from the Current Population Survey, as reported by the Department of Education’s *Condition of Education* report because these data come from the same source as the data on the number of poor children and the number of children enrolled in school. Here we use the Common Core of Data because we wish to compare current prekindergarten enrollment to enrollment in earlier years, something that *The Condition of Education* report does not provide. We are comfortable using the comparative data from Common Core in this instance because the prekindergarten enrollment reported by the Common Core of Data is within 6 percent of that reported by *The Condition of Education*.

87 Authors’ calculation based on the 2004/2005 school year expenditures for state-funded prekindergarten child care and early education (about $2.84 billion) and the total number of children served in the same year (800,000).
Other Federal Programs

There are dozens of other federal programs that provide (or could provide) direct or indirect support for state and local child care programs. The vast majority are small. This report discusses only those that have annual expenditures of more than $200 million a year. In order of size, the six largest are the Child and Adult Care Food Program, the 21st Century Community Learning Centers Program, the Individuals with Disabilities Education Act (IDEA), Title I of the Elementary and Secondary Education Act, Even Start, and the Social Services Block Grant (SSBG). This report discusses them in that order.

**Child and Adult Care Food Program** provides meals to children in child care. The Child and Adult Care Food Program (CACFP) is an entitlement, with funds going to licensed or “approved” child care centers and family or group child day care homes serving both low- and middle-income children. (The CACFP subsidizes providers regardless of whether they receive assistance under CCDF, TANF, or SSBG.) Although the CACFP is not a child care program per se, it provides funds that subsidize the operations of child care providers (especially those serving low-income families). Therefore, it is included in this report’s summary of expenditures of child care programs that help low-income mothers work outside the home.

Subsidies for centers are based on the type of meal served and the child’s family income: Children in families with incomes below 130 percent of poverty receive “free” meals, while those with incomes between 130 and 185 percent of poverty receive “reduced price” meals. Children in families with incomes above 185 percent of poverty receive a small subsidy. Family day care homes receive smaller subsidies per meal than do centers and are divided into two tiers. Tier I payments are higher and are paid to family day care homes in low-income areas or to low-income child care providers. Tier II payments are lower and are paid to family day care homes that do not meet the criteria for a low-income area or provider. If individual children in tier II homes, however, have incomes that qualify them for the higher tier I rates, the family day care provider can be reimbursed at the higher rate.

CACFP funding is determined by multiplying the total number of each type of meal provided by the national average payment rate for that type of meal. Furthermore, funding under this program cannot exceed the sum of (1) other federal funds provided by the state to these participating child care centers and family/group child day care homes, and (2) any funds used by the State under section 10 of the Child Nutrition Act of 1966.

---

88Among the smaller programs excluded from this report are Early Reading First (about $97 million), the Early Learning Fund/Early Learning Opportunities Act Program (about $35 million), the Child Care Access Means Parents in School program (about $17 million), and the Early Childhood Educator Professional Development program (about $16 million). All of these dollar amounts represent 2004 funding levels. Gish, *Child Care Issues in the 108th Congress*, CRS Report RL31817.

It would be reasonable for one to assume that CACFP spending would go up in tandem as child care spending for low-income families increases. However, CACFP funding is not automatic; it requires that the provider apply and be approved. Many providers apparently do not apply or are not qualified to receive assistance.

Between FFY 1997 and FFY 2001, CACFP expenditures remained at a steady level, going from about $1.913 billion to about $1.917 billion. In FFY 2005, expenditures rose to about $2.111 billion.

*Number of children served,* in FFY 2005, was about 3.11 million.90

*Average per-child costs,* in FFY 2005, were about $680.91

**21st Century Community Learning Centers Program** provides grants to local educational agencies, community-based organizations, and other public or private entities to establish or expand after-school programs for students attending schools that are eligible for school-wide programs under the *Elementary and Secondary Education Act*92 or schools that serve a high percentage of low-income families.93

Recipient schools are expected to work with community-based organizations to provide safe, drug-free, supervised learning environments after school, on weekends, and during the summer. Typically, the learning centers offer three types of activities: (1) academic assistance, such as homework tutoring and test preparation; (2) recreation activities, such as gym time or computer use; and (3) cultural and interpersonal activities, such as drama classes or leadership workshops.94
From FFY 1997 to FFY 2002, federal funding increased from about $1.22 million to about $1.086 billion, and then fell to about $991 million in FFY 2005.\(^{95}\)

*Number of children served*, in the 2004/2005 school year, was about 1,155,000.\(^{96}\)

*Average per-child costs*, in FFY 2005, were about $858.\(^{97}\)

NOTE: The 21\(^{st}\) Century program is not included in the summary of expenditures, because it does not provide an organized form of daily child care that working parents can rely on during the after-school hours. However, it might be possible to reorient the program to provide child care, as well as meet its current objectives. Given the past negative evaluations of this program as it is presently configured,\(^{98}\) it seems reasonable to explore the possibility of re-focusing the program on the twin goals of student enrichment and child care.

**Individuals with Disabilities Education Act** includes two parts that provide services for children from birth through preschool age. These services include family training, counseling, home visits, physical therapy, health services, special education, and other related services for disabled children and their families.

The Special Education Preschool Grants programs provides funds to states for special education and related services for disabled children ages three through five (and, at the state’s discretion, to children age two who will turn three during the school year). All states currently participate in the program and are required to serve all eligible children. States must distribute at least 75 percent of their grant to local educational agencies. In FFY 2004, federal funding totaled about $401 million.\(^{99}\) In FFY 2005, federal funding totaled about $385 million.\(^{100}\)
Number of children served, in FFY 2005, was about 699,000.\(^{101}\)

Average per-child costs, in FFY 2005, were about $550.\(^{102}\)

The Grants for Infants and Families program provides early intervention services for infants and toddlers with disabilities. These services include family training, counseling, home visits, physical therapy, and various health services. In FFY 2005, federal funding totaled about $441 million.\(^{103}\)

Number of children served, in FFY 2005, was about 293,816.\(^{104}\)

Average per-child costs, in FFY 2005, were about $1,500.\(^{105}\)

From FFY 1997 to FFY 2001, combined appropriations for these two programs rose slightly, from about $823 million to about $854 million. In FFY 2003, appropriations totaled about $872 million and fell slightly in FFY 2005, to about $825 million.\(^{106}\)

NOTE: The Individuals with Disabilities Education Act programs are not included in the summary of expenditures, because the programs provide services for families with very specific needs and it is not clear the extent to which they are used for employment-related child care. Moreover, because these programs are intended to serve families with very specific needs and, thus, provide very specific services (such as family training, counseling, home visits, physical therapy, and various health services), it is unlikely that they could be reoriented to provide child care assistance for working parents.

\(^{102}\) Authors’ calculation based on FFY 2005 expenditures (about $385 million) and the number of children served in the same year (about 699,000).

\(^{103}\) Individuals with Disabilities Act (IDEA) Data, “State grant awards under Parts B and C of IDEA. Federal fiscal year 2005,” table G-1.

\(^{104}\) Individuals with Disabilities Act (IDEA) Data, “Infants and toddlers receiving early intervention services under IDEA, Part C, by age and state: 2005,” table 6-1.

\(^{105}\) Authors’ calculation based on FFY 2005 expenditures (about $441 million) and the number of children served in the same year (about 293,816).

**Title I of the Elementary and Secondary Education Act** provides funds to help schools meet the educational needs of economically and educationally disadvantaged children from birth to age twenty-one. Title I funds for preschoolers are targeted at children from low-income families and provide educational, medical, and social services. They can also be used to enhance services provided by Head Start, Even Start, or other childhood programs.

Although most of those served by Title I are school-aged children, the U.S. Government Accountability Office (GAO) reports that a growing number of participants are preschoolers. The GAO estimated that, in the 1999/2000 school year, school districts spent about $496 million in Title I funds to support preschool education services. This was about 5 percent of total Title I grants to local education agencies. Assuming that this same percentage applied in the following years would suggest that, in 2004, spending increased to about $596 million, and in 2005, remaining steady at about $595 million.

**Even Start** provides grants to the states for family literacy programs that integrate early childhood education, adult literacy, parenting education, and interactive parent and child literacy activities. Eligible participants include parents who have not earned a high school diploma or its equivalent and their children ages one through seven. Priority is given to programs that serve areas with high levels of poverty, illiteracy, unemployment, or other need-based indicators. In addition to providing various education and supportive services, Even Start also provides funds

---

108 Beth Sinclair, *State ESEA Title I Participation Information for 2000–2001*, Report prepared for the U.S. Department of Education (Washington, DC: DOE, Policy and Program Studies Service, 2004), http://www.ed.gov/rschstat/eval/esa/title-i-participation-2004.pdf (accessed August 23, 2006). This figure represents children in prekindergarten who received Title I funds at public schools designated as requiring school-wide funding (or about 90 percent of all prekindergarten children served under Title I). An additional 33,986 children in prekindergarten were served by Title I funds. Most receive funds through targeted assistance programs (31,325), but a small proportion receive funds through private schools (1,723) or by being designated as neglected or delinquent (938).

for child care while parents participate in the program.\footnote{Elementary and Secondary Education Act, as amended by the No Child Left Behind Act, Public Law 107-110, Title I, Part B, Subpart 3, section 1235 stating that: “Each program assisted under this subpart shall — (3) be designed to accommodate the participants’ work schedule and other responsibilities, including the provision of support services, when those services are unavailable from other sources, necessary for participation in the activities assisted under this subpart, such as – (A) scheduling and locating of services to allow joint participation by parents and children; (B) child care for the period that parents are involved in the program provided under this subpart; and (C) transportation for the purpose of enabling parents and their children to participate in programs authorized by this subpart;”} (Even Start programs typically coordinate services provided under other programs, rather than directly providing their own services.)

\textit{Number of children served}, in FFY 2004, the last year for which data are available, was about 66,515.\footnote{For 2005, no Even Start enrollment data are available, and so we use the 2004 figure found in U.S. Department of Education, “Title I Consolidated Report, Even Start Data Summary” (Washington, DC: DOE, 2005).}

\textit{Average per-child costs}, in FFY 2005, were about $3,383.\footnote{Authors’ calculation based on FFY 2005 expenditures (about $225 million) and the number of children served in 2004 (the last year for which Even Start enrollment data are available). See U.S. Department of Education, “Title I Consolidated Report, Even Start Data Summary” (Washington, DC: DOE, 2005).}

NOTE: Even Start spending is not included in the summary of expenditures, because it does not appear to be used for employment-related child care. Given repeated evaluations that
find Even Start to have little impact\(^\text{115}\) and given the similarity of its goals to Head Start’s, it seems reasonable to explore the possibility of redirecting its funding to Head Start.

**Social Services Block Grant** is used by states to fund various social services, including child care. Social Services Block Grant (SSBG) funds for child care are provided either (1) directly by the state (through state-owned and operated centers), which is very rare these days, or (2) indirectly (through grants and contracts for child care “slots” with selected providers, including centers and licensed family day care homes). Since 1997, the SSBG has been supplemented by TANF transfers\(^\text{116}\).

Between FFY 1997 and FFY 2001, SSBG expenditures on child care declined from about $366 million\(^\text{117}\) to about $222 million\(^\text{118}\) and have since remained at about this level. According to the U.S. Department of Health and Human Services (HHS), in FFY 2005, states spent $241 million of SSBG funds on child care\(^\text{119}\).

**Number of children served** must be estimated. The Department of Health and Human Services reports that, in FFY 2005, the SSBG provided child care services to 4,494,306 children\(^\text{120}\). This implies an annual cost of about $54 per child, which is too low to be accurate.

\(^{116}\)U.S. Department of Health and Human Services, Administration for Children and Families, “Chapter 2: Expenditures,” *Social Service Block Grant Annual Report on Expenditures and Recipients* (Washington, DC: HHS, undated), http://www.acf.hhs.gov/programs/ocs/ssbg/ch2.htm (accessed June 7, 2005), stating: “SSBG service expenditures include funds transferred from TANF for some States and not for others. Because the SSBG reporting instructions were developed prior to the existence of the TANF block grant and State discretion to transfer TANF funds into SSBG, States were left to their own devices as to how to report the funds transferred in from TANF.”

Rather than overstate the number of children served, it is assumed that the average cost of serving children through the SSBG is the same as under the CCDF (about $5,372 in 2005). Thus, in FFY 2005, the $241 million in child care assistance spent through SSBG could have served about 44,862 children.\footnote{This approach is similar to HHS calculations of child care enrollment estimates; however, it assumes a slightly higher cost per child. (The per-child cost under the CCDF is based on total CCDF expenditures rather than direct service expenditures.) See U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation, \textit{Child Care Eligibility and Enrollment Estimates for Fiscal Year 2003}.}

\textit{Average per-child costs}, in FFY 2005, were about $5,372.\footnote{Authors’ calculation based on FFY 2004 expenditures (about $241 million) and the estimated total number of children served in the same year (44,862).}

**Tax Credits for Child Care Expenditures**

Working parents can receive one of two tax credits to offset some of their child care expenditures. Although not always included in listings of child care programs, these tax credits often provide substantial assistance to working parents. They are described in this report even though they provide little assistance to low-income families.

\textbf{Child and Dependent Care Tax Credit} allows working families to claim a tax credit on up to 35 percent of their employment-related child care expenditures for children under age thirteen. The credit is calculated on a sliding scale, based on the taxpayer’s adjusted gross income. Beginning in 2003, taxpayers with incomes up to $15,000 can claim 35 percent of employment-related child care expenses, with the percentage declining by 1 percentage point for each additional $2,000 in income up to $43,000. Taxpayers with incomes above $43,000 can claim 20 percent of allowable expenses. At 35 percent, the maximum credit is $1,050 for one dependent and $2,100 for two or more dependents. At 20 percent, the maximum credit is $600 for one dependent and $1,200 for two or more dependents. This tax credit is not refundable, so families who do not have a tax liability do not benefit from the credit.

In FFY 2005, the U.S. Treasury’s estimated revenue loss due to the credit was about $2.69 billion.\footnote{Tax Policy Center, “Estimates of Total Income Tax Expenditures,” (Washington, DC: Tax Policy Center, undated), http://www.taxpolicycenter.org/TaxFacts/TFDB/Content/PDF/project_taxexpend.pdf (accessed July 9, 2007).} (The Child and Dependent Care Tax Credit is not included in the summary of expenditures because it provides relatively little assistance for low-income families.)

\textbf{Dependent Care Assistance Plan} (DCAP) allows employees whose employers have established a DCAP plan to pay for work-related child care by annually setting aside, tax-free, up to $5,000 of their earned income. These funds then reimburse employees for their
documented child care expenditures. Dependent Care Assistance Plans (DCAPs) can also be structured to provide employers with a $5,000 tax credit per employee if the employer pays for or provides child care. The set-aside funds are also not subject to state taxes. DCAPs may be used by families of all income levels.

In FFY 2003, the Treasury’s estimated revenue loss due to DCAPs was about $597 million; in FFY 2004, it was about 610 million.\(^\text{124}\) (The DCAP is not included in the summary of expenditures, because it provides relatively little assistance for low-income families.)

**Conclusion and Implications**

Between 1997 and 2001, spending under five of the six major programs that account for almost all government spending in child care and early childhood education (all except prekindergarten/preschool programs)—the Child Care and Development Fund, Head Start, Temporary Assistance for Needy Families, the Child and Adult Care Food Program, and the Social Services Block Grant—rose about 69 percent, from about $12.041 billion to about $20.392 billion. (That is an average increase of about 17 percent per year.) Growth then slowed substantially between 2001 and 2003, rising by only about 8 percent, from about $20.39 billion to about $22.06 billion. From 2003 to 2005, total spending declined by about 5 percent to about $20.88 billion, or by about $1.180 billion, with the decline almost entirely in child care spending. At the same time, state spending on prekindergarten/preschool programs has grown rapidly, from an estimated $970 million during the 1991/1992 school year to about $2.84 billion during the 2004/2005 school year.\(^\text{125}\) Across the entire nine-year period, spending rose by about 73.4 percent.

If unspent funds from TANF and the CCDF were included in this calculation, the absolute numbers and the percentage increase between 1997 and 2005 would have been larger—with available funding going from about $16.68 billion to about $28.24 billion. But because these funds represent potential funding for child care, not actual spending, they are not included in the total.

Four smaller programs were also discussed: the 21st Century Community Learning Centers Program, the Individuals with Disabilities Education Act’s Special Education Preschool Grants and Grants for Infants and Families, Title I of the Elementary and Secondary Education Act preschool education funds, and Even Start. These programs were not included in the

---

\(^{124}\) Tax Policy Center, “Estimates of Total Income Tax Expenditures.” For FFY 2005, no data are available for the Treasury’s estimated revenue loss due to DCAPs.

31
summary of total spending because either they do not provide actual child care (or its equivalent) or the amount spent for child care cannot be determined.

This report concludes, however, that two of these programs, the 21st Century Community Learning Centers Program and Even Start, could be reoriented to provide additional child care support for working families. Between 1997 and 2001, spending under these two programs rose a stunning 967 percent, from about $125 million to about $1.209 billion. From 2001 to 2003, spending increased by only about 9 percent, and from 2003 to 2005, spending declined by about 9 percent, from about $1.318 billion to about $1.216 billion (see figure 1, page 4 and table 1, page 5).

Five overarching points about federal and state support for child care emerge from the summary:

(1) Following the passage of the 1996 welfare reform law, the growth in child care spending was dramatic, but has slowed in the recent years.

(2) A significant portion of post-welfare-reform funding for child care comes from unspent TANF block grant funds, making their future availability dependent on TANF caseloads remaining substantially lower than their 1994/1995 levels and continued state support of child care over other spending choices.

(3) Despite some streamlining of child care funding, fragmentation of child care programs is still a problem.

(4) Head Start is losing its dominant place in the constellation of federal child care and early childhood programs. In the 1980s and early 1990s, it was by far the largest early childhood program, amounting to nearly half of total spending in some years. By 2005, it was only about 33 percent of total child care spending (see table 1).

(5) As Head Start’s growth has slowed, state-funded prekindergarten programs have been expanded and are on track to be the dominant early childhood education program for low-income children.
